

Alphabetic List of Functions

Standard Dictionary for Path Semantics

by Sven Nilsen, 2017

A

$\text{add} := \backslash(a, b) = a + b$

When written $\backslash a : [+ b] c$ it means $\backslash a$ plus $\backslash b$ is equal to $\backslash c$.

$\text{and} := \backslash(a : \text{bool}, b : \text{bool}) = a \wedge b$

In C-like programming languages this is equivalent to $\backslash a \ \&\& \ b$.

When written $\backslash a : (\wedge b)$ it means both $\backslash a$ and $\backslash b$ are $\backslash \text{true}$, or neither are.

$\text{acos} : \text{real} \rightarrow \text{real}$

The trigonometric inverse cosine function.

$\text{asin} : \text{real} \rightarrow \text{real}$

The trigonometric inverse sinus function.

$\text{atan} : \text{real} \rightarrow \text{real}$

The trigonometric inverse tangent function.

$\text{atan2} : \text{real} \times \text{real} \rightarrow \text{real}$

The trigonometric inverse tangent function with 2 arguments.

Returns the angle of a vector in radians $\backslash \text{atan2}(y, x)$.

C

$\text{cardinality} : \text{set} \rightarrow \text{nat} \mid \aleph^{\text{N}}$

Returns the cardinality of a set.

$\text{cardinality}(\text{nat}) = \aleph^0$

$\text{cardinality}(\text{real}) = \aleph^1$

$\text{concat} : \text{list} \times \text{list} \rightarrow \text{list}$

Appends the second list to the first list, returning a new list.

$\text{construct}_a : () = a$

Constructs an object.

$\text{cos} : \text{real} \rightarrow \text{real}$

The trigonometric cosine function.

$\text{cross} : \text{vector} \times \text{vector} \rightarrow \text{vector}$

Returns the cross product between two vectors.

D

$\text{dec} := \backslash(a) = a - 1$

$\text{dedup} : \text{list} \rightarrow \text{list}$

Removes duplicates from list, returning a new list.

$\text{det} : \text{matrix} \rightarrow \text{real}$

Returns the determinant of a matrix.

$\text{div} := \backslash(a, b) = a / b$

When written $\backslash a : [/b] c$ it means $\backslash a$ divided by $\backslash b$ is equal to $\backslash c$.

$\text{dot} : \text{vector} \times \text{vector} \rightarrow \text{real}$

Returns the dot product between two vectors.

E

$\text{even} := \backslash(a : \text{nat}) = (a \% 2) == 0$

$\text{even} <=> \text{linear}(0, 2)$

Returns `true` if a number is even.

$\text{eq} := \backslash(a, b) = a == b$

$\text{exc} := \backslash(a : \text{bool}, b : \text{bool}) = a \wedge \neg b$

In C-like programming languages this is equivalent to $\backslash a \ \&\& \ !b$.

$\text{exclude} : \text{set} \times \text{set} \rightarrow \text{set}$

Excludes elements from the second set from the first set.

$\text{exp}_\mathbb{A} := \backslash(a) = e^a$

Returns the natural exponent of a number.

$\text{Exp}_\mathbb{R} : \text{real} \rightarrow \text{real}$

$\text{exp}_\mathbb{C} := \backslash(a : \text{complex}) = \cos(\text{re}(a)) + \mathbf{i} \cdot \sin(\text{im}(a))$

F

$\text{false}_\mathbb{N} := \backslash(_, _, \dots) = \text{false}$

A function that always returns `false`.

$\text{false}_0 := \backslash() = \text{false}$

$\text{false}_1 := \backslash(_) = \text{false}$

$\text{fst} := \backslash((a, b)) = a$

Returns the first element in a tuple.

G

$\text{ge} := \backslash(a, b) = a \geq b$

When written $\backslash a : (>= b)$ it means $\backslash a$ is greater than or equal to $\backslash b$.

$\text{gt} := \backslash(a, b) = a > b$

When written $\backslash a : (> b)$ it means $\backslash a$ is greater than $\backslash b$.

I

$\text{id} := \lambda(x) = x$

$\text{if} := A \times A \rightarrow (\text{bool} \rightarrow A)$

A higher order function used to construct boolean functions.

$\text{inc} := \lambda(a) = a + 1$

$\text{intersect} : \text{set} \times \text{set} \rightarrow \text{set}$

Returns a new set containing elements belonging to both sets.

$\text{im} : \text{complex} \rightarrow \text{real}$

Returns the imaginary part of a complex number.

J

$\text{join} \leq \Rightarrow \text{add}$

Used to reason about circuit diagrams.

$\text{len} : \text{list} \rightarrow \text{nat}$

L

$\text{le} := \lambda(a, b) = a \leq b$

When written $\lambda a : (\leq b)$ it means λa is less than or equal to b .

$\text{linear} := \lambda(a : \text{nat}, b : \text{nat} \wedge (> 0)) = \lambda(x) = \text{if } x < a \{ \text{false} \} \text{ else } \{ ((x - a) \% b) == 0 \}$

Returns true if a natural number is in a linear sequence of natural numbers.

$\text{ln} : \text{real} \rightarrow \text{real}$

Returns the natural logarithm of a number.

$\text{lt} := \lambda(a, b) = a < b$

When written $\lambda a : (< b)$ it means λa is less than b .

M

$\text{mat_add} : \text{matrix} \times \text{matrix} \rightarrow \text{matrix}$

Matrix addition.

$\text{mat_dim} : \text{matrix} \rightarrow (\text{nat}, \text{nat})$

Returns the dimensions of the matrix $(\text{rows}, \text{columns})$.

$\text{mat_mul} : \text{matrix} \times \text{matrix} \rightarrow \text{matrix}$

Matrix multiplication, row major.

$\text{mat_trace} : \text{matrix} \rightarrow \text{vector}$

$\text{max} := \lambda(a : \text{list}) = \max i \{ a[i] \}$

$\text{min} := \lambda(a : \text{list}) = \min i \{ a[i] \}$

$\text{mul} := \lambda(a, b) = a \cdot b$

When written $\lambda a : [\cdot b] c$ it means λa multiplied with b is equal to c .

N

$\text{nand} := \lambda(a : \text{bool}, b : \text{bool}) = \text{not}(\text{and}(a, b))$

$\text{neq} <=> \text{xor}$

$\text{nexc} := \lambda(a : \text{bool}, b : \text{bool}) = \text{not}(\text{exc}(a, b))$

$\text{nor} := \lambda(a : \text{bool}, b : \text{bool}) = \text{not}(\text{or}(a, b))$

$\text{not} := \lambda(a : \text{bool}) = \neg a$

In C-like programming languages this is written `!a`.

$\text{nrex} := \lambda(a : \text{bool}, b : \text{bool}) = \text{not}(\text{rex}(a, b))$

$\text{nxor} <=> \text{eq}$

O

$\text{odd} := \lambda(a : \text{nat}) = (a \% 2) == 1$

$\text{odd} <=> \text{linear}(1, 2)$

Returns `true` if a number is odd.

$\text{or} := \lambda(a : \text{bool}, b : \text{bool}) = a \vee b$

In C-like programming languages this is equivalent to `a || b`.

When written `a : (v b)` it means `a` or `b` are `true`.

P

$\text{prime} : \text{nat} \rightarrow \text{bool}$

Returns `true` if natural number is a prime number.

$\text{pop} : \text{list} \rightarrow (\text{list}, \text{any})$

Removes an item from a list, returning a new list and the item removed.

$\text{pow}_A : A \times A \rightarrow A$

Returns the power of a number.

When written `a : [^ b] c` it means `a` powered by `b` is equal to `c`.

$\text{pow}_{\mathbb{N}} : \text{nat} \times \text{nat} \rightarrow \text{nat}$

$\text{pow}_{\mathbb{R}} : \text{real} \times \text{real} \rightarrow \text{real}$

$\text{pow}_{\mathbb{C}} : \text{complex} \times \text{complex} \rightarrow \text{complex}$

$\text{prod} := \lambda(a : \text{list}) = \prod i \{ a[i] \}$

$\text{push} : \text{list} \times \text{any} \rightarrow \text{list}$

Pushes an item to the end of a list

R

$\text{re} := \text{complex} \rightarrow \text{real}$

Returns the real part of a complex number.

$\text{rem} := \lambda(a, b) = a \% b$

Also called “modulus binary operator”.

This is the rest value you get after integer division.

When written `a : [% b] c` it means `a` modulus `b` is equal to `c`.

$\text{rex} := \lambda(a : \text{bool}, b : \text{bool}) = b \wedge \neg a$

In C-like programming languages this is equivalent to `b && !a`.

S

$\text{sequence} := \lambda(a : \text{nat}, b : \text{nat} \wedge (> 0)) = \lambda(x) = a + b \cdot x$

Maps from natural numbers to a linear sequence of natural numbers.

$\sin : \text{real} \rightarrow \text{real}$

The trigonometric sinus function.

$\text{snd} := \lambda((a, b)) = b$

Returns the second element of a tuple.

$\text{sort}_f := \text{list} \rightarrow \text{list}$

Sorts a list by function `f`.

When `f` is not specified, default ascending order is used.

$\text{split} := \lambda(s : \text{real}) = \lambda(x : \text{real}) = (s \cdot x, (1 - s) \cdot x)$

Used to reason about circuit diagrams.

$\text{square_len} := \lambda(a : \text{vector}) = \sum i \{ a[i] \cdot a[i] \}$

$\text{sqrt}_A : A \rightarrow A$

Takes the square root of a number.

$\text{sqrt}_{\mathbb{N}} : \text{nat} \rightarrow \text{nat}$

Defined only for square numbers.

$\text{sqrt}_{\mathbb{R}} : \text{real} \rightarrow \text{real}$

Defined only for non-negative numbers.

$\text{sqrt}_{\mathbb{C}} : \text{complex} \rightarrow \text{complex}$

Automatic conversion from real to complex number.

$\text{strict_subset} : \text{set} \times \text{set} \rightarrow \text{bool}$

Returns `true` if all elements of the first set belongs to the second set, and the two sets do not have equal cardinality.

When written `a : (\subset b)` it means `a` is a strict subset of `b`.

$\text{sub} := \lambda(a, b) = a - b$

$\text{subset} : \text{set} \times \text{set} \rightarrow \text{bool}$

Returns `true` if all elements of the first set belongs to the second set.

When written `a : (\subseteq b)` it means `a` is a subset of `b`.

$\text{sum} := \lambda(a : \text{list}) = \sum i \{ a[i] \}$

T

$\tan : \text{real} \rightarrow \text{real}$

The trigonometric tangent function.

$\text{true}_{\mathbb{N}} := \lambda(_, _, \dots) = \text{true}$

A function that always returns `true`.

$\text{true}_0 := \lambda() = \text{true}$

$\text{false}_1 := \lambda() = \text{false}$

U

$\text{union} : \text{set} \times \text{set} \rightarrow \text{set}$

Returns the union of two sets.

When written $a : [\cup b] c$ it means a union b results in c .

$\text{unit} : \text{any} \rightarrow ()$

Used to erase information about an input argument.

V

$\text{vec_dim} : \text{vector} \rightarrow \text{nat}$

Returns the number of dimensions of a vector.

X

$x : \text{vector} \rightarrow \text{real}$

Returns the x-component of a vector.

$\text{xor} := \lambda(a : \text{bool}, b : \text{bool}) = a \wedge \neg b \vee \neg a \wedge b$

In C-like programming languages this is equivalent to “ $a \ \&\& \ !b \ || \ !a \ \&\& \ b$ ”.

When written $a : (\vee b)$ it means either a or b is `true`, but not both.

Y

$y : \text{vector} \rightarrow \text{real}$

Returns the y-component of a vector.

Z

$z : \text{vector} \rightarrow \text{real}$

Returns the z-component of a vector.

W

$w : \text{vector} \rightarrow \text{real}$

Returns the w-component of a vector.
