

# Alphabetic List of Functions

## Standard Dictionary for Path Semantics

by Sven Nilsen, 2017

### A

$\text{abs} := \lambda(a) = \text{if } a < 0 \{ -a \} \text{ else } \{ a \}$

$\text{add}_A := \lambda(a : A, b : A) = a + b$

*When written  $\text{`a : [+ b] c`}$  it means  $\text{`a`}$  plus  $\text{`b`}$  is equal to  $\text{`c`}$ .*

$\text{add}_{\mathbb{C}} : \text{complex} \times \text{complex} \rightarrow \text{complex}$

$\text{add}_{\mathbb{N}} : \text{nat} \times \text{nat} \rightarrow \text{nat}$

$\text{add}_{\mathbb{Q}} : \text{rational} \times \text{rational} \rightarrow \text{rational}$

$\text{add}_{\mathbb{R}} : \text{real} \times \text{real} \rightarrow \text{real}$

$\text{add}_{\mathbb{Z}} : \text{int} \times \text{int} \rightarrow \text{int}$

$\text{and} := \lambda(a : \text{bool}, b : \text{bool}) = a \wedge b$

*In C-like programming languages this is equivalent to  $\text{`a \&\& b`}$ .*

*When written  $\text{`a : (\wedge b)`}$  it means both  $\text{`a`}$  and  $\text{`b`}$  are  $\text{`true`}$ , or neither are.*

$\text{acos} : \text{real} \rightarrow \text{real}$

*The trigonometric inverse cosine function.*

$\text{asin} : \text{real} \rightarrow \text{real}$

*The trigonometric inverse sinus function.*

$\text{asym} : \lambda(m : \text{matrix} \wedge [\text{dim}] [\text{eq}] \text{true}) = \forall i, j \{ m[i][j] == -m[j][i] \}$

$\text{atan} : \text{real} \rightarrow \text{real}$

*The trigonometric inverse tangent function.*

$\text{atan}_2 : \text{real} \times \text{real} \rightarrow \text{real}$

*The trigonometric inverse tangent function with 2 arguments.*

*Returns the angle of a vector in radians  $\text{`atan2(y, x)`}$ .*

## C

cardinality : set → nat |

*Returns the cardinality of a set.*

*The cardinality of infinite sets can be of higher order infinity ( $\aleph^N$ ).*

cardinality(nat) =  $\aleph^0$

cardinality(real) =  $\aleph^1$

concat : list × list → list

*Appends the second list to the first list, returning a new list.*

construct<sub>a</sub> := \() = a

*Constructs an object.*

cos : real → real

*The trigonometric cosine function.*

cross := \((a : vector ∧ [vec\_dim] 3, b : vector ∧ [vec\_dim] 3) =

$(y(a) \cdot z(b) - z(a) \cdot y(b), z(a) \cdot x(b) - x(a) \cdot z(b), x(a) \cdot y(b) - y(a) \cdot x(b))$

*Returns the cross product between two vectors.*

*This is defined only for vectors in 3 dimensions.*

*When written `a : [× b] c` it means the cross product of `a` and `b` is `c`.*

## D

dec := \((a) = a - 1

dedup : list → list

*Removes duplicates from list, returning a new list.*

det : matrix → real

*Returns the determinant of a matrix.*

diag := \((m : matrix ∧ [dim] [eq] true) =  $\forall i, j \{ \text{if } i == j \{ \text{continue} \} \text{ else } \{ m[i][j] == 0 \} \}$

*Returns `true` if matrix is a diagonal matrix.*

dim : matrix → (nat, nat)

*Returns the dimensions of the matrix `(rows, columns)`.*

div := \((a : A, b : A) = a / b

*When written `a : [/ b] c` it means `a` divided by `b` is equal to `c`.*

div\_exact<sub>ℕ</sub> := \((a : nat ∧ [% b] 0, b : nat ∧ (≠ 0)) → nat { a / b }

dot := \((a : vector ∧ [vec\_dim] n, b : vector ∧ [vec\_dim] n) =  $\sum i \{ a[i] \cdot b[i] \}$

*Returns the dot product between two vectors.*

*When written `a : [· b] c` it means the dot product of `a` and `b` equals `c`.*

dup : \((a) = (a, a)

## E

$\text{each\_connected} := \lambda(m : \text{matrix}) = \forall i \{ \sum j \{ m[i][j] \} > 0 \}$

*Used to reason about molecule structures where each atom must be connected.*

$\text{el} : \text{nat} \times \text{nat} \times \text{matrix} \rightarrow \text{any}$

*Returns element of matrix at row and column index.*

*Notice that this is row major, such that `y` becomes before `x`.*

$\text{even} := \lambda(a : \text{nat}) = (a \% 2) == 0$

$\text{even} <=> \text{linear}(0, 2)$

*Returns `true` if a number is even.*

$\text{eq} := \lambda(a, b) = a == b$

$\text{exc} := \lambda(a : \text{bool}, b : \text{bool}) = a \wedge \neg b$

*In C-like programming languages this is equivalent to `a && !b`.*

$\text{exclude} : \text{set} \times \text{set} \rightarrow \text{set}$

*Excludes elements from the second set from the first set.*

$\text{exp}_\mathbb{A} := \lambda(a : \mathbb{A}) = e^a$

*Returns the natural exponent of a number.*

$\text{exp}_\mathbb{R} : \text{real} \rightarrow \text{real}$

$\text{exp}_\mathbb{C} := \lambda(a : \text{complex}) = \cos(\text{re}(a)) + \mathbf{i} \cdot \sin(\text{im}(a))$

## F

$\text{factorize} : \text{nat} \rightarrow \text{list}$

*Returns a sorted list of prime factors of natural number.*

$\text{factorial} := \lambda(x : \text{nat}) = \prod i [0, x+1) \{ i \}$

$\text{false}_\mathbb{N} := \lambda(\_, \_, \dots) = \text{false}$

*A function that always returns `false`.*

$\text{false}_0 := \lambda() = \text{false}$

$\text{false}_1 := \lambda(\_) = \text{false}$

$\text{fract} := \lambda(a : \text{real}) = a \% 1$

$\text{fst} := \lambda((a, b)) = a$

*Returns the first element in a tuple.*

## G

$\text{ge} := \lambda(a, b) = a >= b$

*When written `a : (>= b)` it means `a` is greater than or equal to `b`.*

$\text{gt} := \lambda(a, b) = a > b$

*When written `a : (> b)` it means `a` is greater than `b`.*

## I

$\text{id}_A := \lambda(x : A) = x$

$\text{if} := A \times A \rightarrow (\text{bool} \rightarrow A)$

*A higher order function used to construct boolean functions.*

$\text{inc} := \lambda(a) = a + 1$

$\text{intersect} : \text{set} \times \text{set} \rightarrow \text{set}$

*Returns a new set containing elements belonging to both sets.*

$\text{inv} : \lambda(a) = 1 / a$

$\text{invert} \Leftrightarrow \text{mat\_inv}$

$\text{im} : \text{complex} \rightarrow \text{real}$

*Returns the imaginary part of a complex number.*

## J

$\text{join} \Leftrightarrow \text{add}$

*Used to reason about circuit diagrams.*

$\text{len} : \text{list} \rightarrow \text{nat}$

## L

$\text{le} := \lambda(a, b) = a \leq b$

*When written  $a : (<= b)$  it means  $a$  is less than or equal to  $b$ .*

$\text{linear} := \lambda(a : \text{nat}, b : \text{nat} \wedge (> 0)) = \lambda(x) = \text{if } x < a \{ \text{false} \} \text{ else } \{ ((x - a) \% b) == 0 \}$

*Returns  $\text{true}$  if a natural number is in a linear sequence of natural numbers.*

$\text{ln} : \text{real} \rightarrow \text{real}$

*Returns the natural logarithm of a number.*

$\text{lt} := \lambda(a, b) = a < b$

*When written  $a : (< b)$  it means  $a$  is less than  $b$ .*

## M

`mat_add : matrix × matrix → matrix`

*Matrix addition.*

`mat_id : nat → matrix`

*Constructs an identity matrix.*

`mat_inv : matrix → matrix`

*Returns the inverse matrix.*

`mat_mul : matrix × matrix → matrix`

*Matrix multiplication, row major.*

`max_bounds := \ (n : nat) = \ (m : matrix) =  $\forall i \{ \sum j \{ m[i][j] \} \leq n \}$`

*Used to reason about molecule structures where each atom has a limited number of bounds.*

`max := \ (a : list) = max i { a[i] }`

`max2 := \ (a, b) = if a > b { a } else { b }`

`min := \ (a : list) = min i { a[i] }`

`min2 := \ (a, b) = if a < b { a } else { b }`

`mulA := \ (a : A, b : A) = a · b`

*When written `a : [· b] c` it means `a` multiplied with `b` is equal to `c`.*

`mulℂ : complex × complex → complex`

`mulℕ : nat × nat → nat`

`mulℚ : rational × rational → rational`

`mulℝ : real × real → real`

`mulℤ : int × int → int`

## N

`nand := \ (a : bool, b : bool) = not (and (a, b))`

`negA := \ (a : A) = -a`

`negℂ : complex → complex`

`negℚ : rational → rational`

`negℝ : real → real`

`negℤ : int → int`

`neq <=> xor`

`nexc := \ (a : bool, b : bool) = not (exc (a, b))`

`non_diag := \ (m : matrix ∧ [dim] [eq] true) =  $\forall i \{ m[i][i] == 0 \}$`

*Returns `true` when all elements on the diagonal are zero.*

`nor := \ (a : bool, b : bool) = not (or (a, b))`

`not := \ (a : bool) = ¬a`

*In C-like programming languages this is written `!a`.*

`nrex := \ (a : bool, b : bool) = not (rex (a, b))`

`nxor <=> eq`

## O

$\text{odd} := \lambda(a : \text{nat}) = (a \% 2) == 1$

$\text{odd} \iff \text{linear}(1, 2)$

*Returns `true` if a number is odd.*

$\text{or} := \lambda(a : \text{bool}, b : \text{bool}) = a \vee b$

*In C-like programming languages this is equivalent to `a || b`.*

*When written `a : (v b)` it means `a` or `b` are `true`.*

## P

$\text{pair} := \lambda(a) = \lambda(b) = (a, b)$

$\text{prime} : \text{nat} \rightarrow \text{bool}$

*Returns `true` if natural number is a prime number.*

$\text{pop} : \text{list} \rightarrow (\text{list}, \text{any})$

*Removes an item from a list, returning a new list and the item removed.*

$\text{pow}_A : A \times A \rightarrow A$

*Returns the power of a number.*

*When written `a : [<sup>a</sup>b] c` it means `a` powered by `b` is equal to `c`.*

$\text{pow}_\mathbb{C} : \text{complex} \times \text{complex} \rightarrow \text{complex}$

$\text{pow}_\mathbb{N} : \text{nat} \times \text{nat} \rightarrow \text{nat}$

$\text{pow}_\mathbb{Q} : \text{rational} \times \text{rational} \rightarrow \text{rational}$

$\text{pow}_\mathbb{R} : \text{real} \times \text{real} \rightarrow \text{real}$

$\text{pow}_\mathbb{Z} : \text{int} \times \text{int} \rightarrow \text{int}$

$\text{prod} := \lambda(a : \text{list}) = \prod i \{ a[i] \}$

$\text{push} : \text{list} \times \text{any} \rightarrow \text{list}$

*Pushes an item to the end of a list*

## R

$\text{re} := \text{complex} \rightarrow \text{real}$

*Returns the real part of a complex number.*

$\text{rem} := \lambda(a, b) = a \% b$

*Also called “modulus binary operator”.*

*This is the rest value you get after integer division.*

*When written `a : [% b] c` it means `a` modulus `b` is equal to `c`.*

$\text{rexc} := \lambda(a : \text{bool}, b : \text{bool}) = b \wedge \neg a$

*In C-like programming languages this is equivalent to `b && !a`.*

# S

$sc := \backslash(sc, f) = \backslash(n) = f(sc(sc, f), n)$   
 $sc(sc) : ((A \rightarrow B) \times A \rightarrow B) \rightarrow (A \rightarrow B)$   
*A convenient fixed point combinator that allows anonymous recursive calls, using the first parameter as a `self` function.*  
*Here is an example of generating the numbers in the Fibonacci sequence:*  
 $fib := \backslash(self : nat \rightarrow nat, n : nat) = \text{if } n == 0 \{ 0 \} \text{ else if } n == 1 \{ 1 \} \text{ else } \{ self(n-1) + self(n-2) \}$   
 $call\_fib := sc(sc, fib)$   
 $call\_fib(20) \quad \quad \quad // 6765$   
 $sequence := \backslash(a : nat, b : nat \wedge (> 0)) = \backslash(x) = a + b \cdot x$   
*Maps from natural numbers to a linear sequence of natural numbers.*  
 $\sin : real \rightarrow real$   
*The trigonometric sinus function.*  
 $snd := \backslash((a, b)) = b$   
*Returns the second element of a tuple.*  
 $sort_f := list \rightarrow list$   
*Sorts a list by function `f`.*  
*When `f` is not specified, default ascending order is used.*  
 $sorted_f := list \rightarrow bool$   
*Returns `true` if list is sorted by function `f`.*  
*When `f` is not specified, default ascending order is used.*  
 $split := \backslash(s : real) = \backslash(x : real) = (s \cdot x, (1 - s) \cdot x)$   
*Used to reason about circuit diagrams.*  
 $square\_len := \backslash(a : vector) = \sum i \{ a[i] \cdot a[i] \}$   
 $\sqrt{\phantom{x}}_A : A \rightarrow A$   
*Takes the square root of a number.*  
 $\sqrt{\phantom{x}}_{\mathbb{N}} : nat \rightarrow nat$   
*Defined only for square numbers.*  
 $\sqrt{\phantom{x}}_{\mathbb{R}} : real \rightarrow real$   
*Defined only for non-negative numbers.*  
 $\sqrt{\phantom{x}}_{\mathbb{C}} : complex \rightarrow complex$   
*Automatic conversion from real to complex number.*  
 $strict\_subset : set \times set \rightarrow bool$   
*Returns `true` if all elements of the first set belongs to the second set, and the two sets do not have equal cardinality.*  
*When written `a : ( $\subset$  b)` it means `a` is a strict subset of `b`.*  
 $sub_A := \backslash(a : A, b : A) = a - b$   
*When written `a : [- b] c` it means `a` minus `b` is equal to `c`.*  
 $sub_{\mathbb{C}} : complex \times complex \rightarrow complex$   
 $sub_{\mathbb{N}} : \backslash(a : nat \wedge (>= b), b : nat) \rightarrow nat = \{ a - b \}$   
 $sub_{\mathbb{Q}} : rational \times rational \rightarrow rational$   
 $sub_{\mathbb{R}} : real \times real \rightarrow real$   
 $sub_{\mathbb{Z}} : int \times int \rightarrow int$   
 ...

## ...S (continued)

subset : set  $\times$  set  $\rightarrow$  bool

*Returns `true` if all elements of the first set belongs to the second set.*

*When written `a : ( $\subseteq$  b)` it means `a` is a subset of `b`.*

sum :=  $\backslash(a : \text{list}) = \sum i \{ a[i] \}$

swap :=  $\backslash((a, b)) = (b, a)$

sym :=  $\backslash(m : \text{matrix} \wedge [\text{dim}] [\text{eq}] \text{true}) = \forall i, j \{ m[i][j] == m[j][i] \}$

## T

tan : real  $\rightarrow$  real

*The trigonometric tangent function.*

trace :=  $\backslash(m : \text{matrix}) = \sum i, i \{ m[i][i] \}$

transpose : matrix  $\rightarrow$  matrix

*Returns the transposed matrix, where rows are swapped with columns.*

true<sub>N</sub> :=  $\backslash(\_, \_, \dots) = \text{true}$

*A function that always returns `true`.*

true<sub>0</sub> :=  $\backslash() = \text{true}$

false<sub>1</sub> :=  $\backslash() = \text{false}$

## U

union : set  $\times$  set  $\rightarrow$  set

*Returns the union of two sets.*

*When written `a : [ $\cup$  b] c` it means `a` union `b` results in `c`.*

unit : any  $\rightarrow ()$

*Used to erase information about an input argument.*

## V

vec\_dim : vector  $\rightarrow$  nat

*Returns the number of dimensions of a vector.*

## X

x : vector  $\rightarrow$  real

*Returns the x-component of a vector.*

xor :=  $\backslash(a : \text{bool}, b : \text{bool}) = a \wedge \neg b \vee \neg a \wedge b$

*In C-like programming languages this is equivalent to “a && !b || !a && b”.*

*When written `a : ( $\vee$  b)` it means either `a` or `b` is `true`, but not both.*

## Y

$y : \text{vector} \rightarrow \text{real}$

*Returns the y-component of a vector.*

## Z

$z : \text{vector} \rightarrow \text{real}$

*Returns the z-component of a vector.*

## W

$w : \text{vector} \rightarrow \text{real}$

*Returns the w-component of a vector.*
