

# Finding Normal Paths Using Zero Order Existential Paths

by Sven Nilsen, 2017

The zero order existential path `even\_sequence` which first order existential path is `even` is a function mapping every natural number to an even number:

$$\text{even\_sequence} := \lambda(x: \text{nat}) = 2 \cdot x$$
$$\exists \text{even\_sequence} \Leftrightarrow \text{even}$$

The inverse zero order existential path is `odd\_sequence`:

$$\text{odd\_sequence} := \lambda(x: \text{nat}) = 2 \cdot x + 1$$
$$\exists \text{odd\_sequence} \Leftrightarrow \neg \exists \text{even\_sequence}$$

In path semantics, you can search for a normal path by transforming input and output of the function, but this requires the assumption that there are no 2 objects which the transformed output gives different results:

$$\exists x_i, y_i \{ g_i(x_i) = g_i(y_i) \wedge g_n(f(x_i)) \neq g_n(f(y_i)) \} \Rightarrow \neg \exists f[g_{i \rightarrow n}]$$

Notice that `∃ f[g<sub>i→n</sub>]

` means “existence of path” while `∃ f` means “existential path”. The space is significant.

One can break down the operations in an expressions, here with the first order existential path, to find a normal path. For example:

$$f(a, b) = a + b + a \cdot b$$
$$\text{add}[\text{even}] \Leftrightarrow \text{eq}$$
$$\text{add}[\text{odd}] \Leftrightarrow \text{xor}$$
$$\text{mul}[\text{even}] \Leftrightarrow \text{or}$$
$$\text{mul}[\text{odd}] \Leftrightarrow \text{and}$$
$$\text{even}(a + b + a \cdot b)$$
$$\text{even}(a + b) == \text{even}(a \cdot b)$$
$$(\text{even}(a) == \text{even}(b)) == (\text{even}(a) \parallel \text{even}(b))$$
$$\text{even}(a) \&\& \text{even}(b)$$
$$f[\text{even}] \Leftrightarrow \text{and}$$

Once `f[even]` is found one can easily find `f[odd]`:

$$f[\text{odd}] \Leftrightarrow f[\text{odd}][\text{not}] \Leftrightarrow \text{and}[\text{not}] \Leftrightarrow \text{or}$$

There is another way that uses the zero order existential path. Instead of transforming the expression, one inserts the expressions of `even\_sequence` and `odd\_sequence` and determines whether the solved equation is a natural number. Since there is a map from any natural number to the sequence of even or odd numbers, it means if the solution yields a non-natural number, the value is returned by the inverse zero order existential path:

$$a + b + a \cdot b$$

$$\begin{aligned}(2 \cdot n) + (2 \cdot m) + (2 \cdot n) \cdot (2 \cdot m) &= (2 \cdot r) \\ (2 \cdot n) + (2 \cdot m + 1) + (2 \cdot n) \cdot (2 \cdot m + 1) &= (2 \cdot r) \\ (2 \cdot n + 1) + (2 \cdot m) + (2 \cdot n + 1) \cdot (2 \cdot m) &= (2 \cdot r) \\ (2 \cdot n + 1) + (2 \cdot m + 1) + (2 \cdot n + 1) \cdot (2 \cdot m + 1) &= (2 \cdot r)\end{aligned}$$

$$\begin{array}{ll}n + m + 2 \cdot n \cdot m = r & \text{(natural number, returned by `even`)} \\ n + m + \frac{1}{2} + n + 2 \cdot n \cdot m = r & \text{(rational number, returned by `odd`)} \\ n + \frac{1}{2} + m + 2 \cdot n \cdot m + m = r & \text{(rational number, returned by `odd`)} \\ n + \frac{1}{2} + m + \frac{1}{2} + 2 \cdot n \cdot m + n + m + \frac{1}{2} = r & \text{(rational number, returned by `odd`)}\end{array}$$

$$f[\text{even}] \iff \text{and}$$

This method works by using `even\_sequence` and `odd\_sequence` as boolean values to find the truth table. The proof relies on a non-trivial way to detect whether an expression is a natural number or a rational number. For example, you can add  $\frac{1}{2} + \frac{1}{2} = 1$  which is a natural number, but if you have 3 of them then you get a rational number.

The simplest way of proving it is through transformation with path semantics:

$$\begin{aligned}\text{even}(a + b + a \cdot b) \\ \text{even}(a) \ \&\& \ \text{even}(b) \\ f[\text{even}] \iff \text{and}\end{aligned}$$

One reason this is simpler is because normal paths are total functions. When we solve the equation for `r` we only check a partial function, so we need to solve  $2^N$  number of equations where N is number of inputs. finding normal paths using zero order existential paths is more work than using the first order existential path directly.
